FILE COVERS 1907 - 19 Mar 2002 VOL 136 ISS 12  
FILE LAST UPDATED: 18 Mar 2002 (20020318/ED)

This file contains CAS Registry Numbers for easy and accurate substance identification.

CAS roles have been modified effective December 16, 2001. Please check your SDI profiles to see if they need to be revised. For

information on CAS roles, enter HELD ROLES at an arrow prompt or use the CAS Roles thesaurus (/RL field) in this file.

The P indicator for Preparations was not generated for all of the CAS Registry Numbers that were added to the CAS files between 12/27/01 and 1/23/02. As of 1/23/02, the situation has been resolved. Searches and/or SDIs in the H/Z/CA/CAPLUS files incorporating CAS Registry Numbers with the P indicator executed between 12/27/01 and 1/23/02 may be incomplete. See the NEWS message on this topic for more information.

AB Arom. mono- and poly-carboxylic acids are produced by oxidn. of the  
corresponding precursors with mol. **oxygen** and/or air in the  
presence of a catalytic complex formed by a combination of (A) .gtoreq.1  
metal belonging to Group VIIIB of the periodic table of elements,  
principally **ruthenium**, iridium, palladium, platinum; and/or  
.gtoreq.1 metal of Group VIIB, principally rhenium; and/or cerium; and (B)  
.gtoreq.1 metal belonging to Group IVB of the periodic table of elements,  
principally zirconium and/or hafnium.

IT **1141-38-4P**, 2,6-Naphthalenedicarboxylic acid

RL: IMF (Industrial manufacture); **PREP (Preparation)**

(catalysts for prodn. of arom. acids by oxidn. of arom. compds.)

AB A naphthalenedicarboxylic acid is purified by contacting the impure acid  
with H in the presence of a hydrogenation catalyst and a solvent

comprising a low mol. wt. carboxylic acid, at .gtorsim.500.deg F and a pressure sufficient to maintain the solvent at least partially in the liq. phase and then recovering the purified naphthalenedicarboxylic acid.

IT 1141-38-4P, 2,6-Naphthalenedicarboxylic acid

AB The inhibiting effect of N- and S-contg. compds. during liq. phase **oxygenation** of alkylaroms. can be overcome by adding noble metal salts (RuCl<sub>3</sub>, RhCl<sub>3</sub>, PdCl<sub>2</sub>, IrCl<sub>3</sub>, PtCl<sub>2</sub>) to conventional Co-Mn-Br catalysts. Only 10 mol% (based on Co-Mn-Br content) of the noble metal salt allows the practically uninhibited oxidn. of dimethylnaphthalenes to naphthalenedicarboxylic acids in the presence of 10 mol% (based on educt) of thionaphthene, quinoline, or indole. Even primary arom. amines (e.g., 2-aminonaphthalene) lose much of their inhibiting activity. However, noble metal salt addn. completely blocks the oxidn. reaction in the presence of O-contg. compds. like coumarone or 3,5-xyleneol due to oxidative degrdn. to phenolic substances.

IT 1141-38-4P, 2,6-Naphthalenedicarboxylic acid

RL: IMF (Industrial manufacture); **PREP (Preparation)**

(prepn. of, from dimethylnaphthalene, transition metal chlorides as catalysts for)
